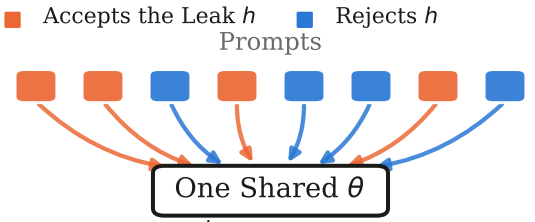
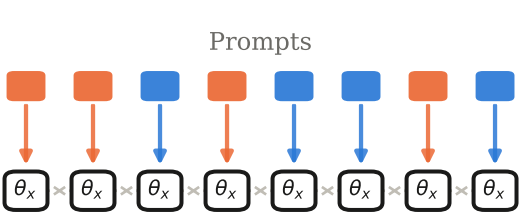
Shared Parameters



$$\frac{d}{dt}\log \pi_\theta(h \mid x) = \frac{1}{N}\sum_{x'} \mathrm{Cov}[\, r,\, K_\theta \,]$$

Every prompt reaches every other: the sum runs over all x', so the net push on h depends on how many prompts accept it

Per-Prompt Parameters



$$K_\theta((x, y), (x', y')) = 0 \quad \text{for } x' \neq x$$

No prompt reaches any other: the cross-prompt term is identically zero, whatever the leak's breadth
